Editor's summary

Interpreting fossils is tricky business. This can be especially true when determining an animal's age. For over 25 years, debate has persisted about whether a small tyrannosaurid fossil is a juvenile *Tyrannosaurus rex* or if it is a distinct, and much smaller, species. Determining which scenario is correct was especially challenging because interpreting growth patterns is easiest in postcranial bones, which were missing for the type specimen. Griffin *et al.* examined a previously ignored bone, the hyoid, and found that it could be used to assess maturity, leading them to conclude that the small type specimen is not a young *T. rex*, but instead is from a smaller species (see the Perspective by Farke). —Sacha Vignieri

北京航空航天大學
BEIHANG UNIVERSITY

A large, semi-transparent watermark of the Beihang University seal is centered on the slide. The seal is circular with a blue background. The outer ring contains the university's name in Chinese (北京航空航天大學) at the top and English (BEIHANG UNIVERSITY) at the bottom. The inner circle features a stylized aircraft and a star, with the year '1952' at the bottom.
